Ultimately it probably doesn't have a safe `.get` method because a dict is an associative collection (values are associated with names) where it is inefficient to check if a key is present (and return its value) ...

ajax jquery simple get request Asked 13 years, 11 months ago Modified 6 years, 5 months ago Viewed 264k times

Is it possible to pass parameters with an HTTP get request? If so, how should I then do it? I have found an HTTP post request (link). In that example the string postData is sent to a webserver. I ...

The get/set pattern provides a structure that allows logic to be added during the setting ("set") or retrieval ("get") of a property instance of an instantiated class, which can be useful when some instantiation ...

What does request.GET.get mean? Asked 8 years, 7 months ago Modified 6 years, 5 months ago Viewed 46k times

From what I can gather, there are three categories: Never use GET and use POST Never use POST and use GET It doesn't matter which one you use. Am I correct in assuming those three ...

So, I've come up with a simpler script that returns all the GET parameters in a single object. You should call it just once, assign the result to a variable and then, at any point in the future, get any value you ...

What is confusing you? You evidently know what `.get` invoked on a dictionary does, that's what's being called for each key in the dictionary.

Here the `get` method finds a key entry for "e" and finds its value which is 1. We add this to the other 1 in `characters.get (character, 0) + 1` and get 2 as result.

The "get" lets you treat a class method, as if it were a simple property in an object. If you leave off the "get", you can still access the value by calling `.area ()` instead of just `.area`
